Part I: Weak Cosmic Censorship and Naked Singularities

Conjecture (Weak Cosmic Censorship for Einstein Vacuum Equations) If the initial data is complete, regular, and asymptotically flat, then singularities in the corresponding maximal spacetime are generically hidden inside a black hole.

Conjecture (Weak Cosmic Censorship for Einstein Vacuum Equations) If the initial data is complete, regular, and asymptotically flat, then singularities in the corresponding maximal spacetime are generically hidden inside a black hole.

At time of original formulation (Penrose 69) only evidence originally was that all known explicit examples satisfied the conjecture!

The Weak Cosmic Censorship Conjecture (in 3 + 1 Dimensions)

Conjecture (Weak Cosmic Censorship for Einstein Vacuum Equations) If the initial data is complete, regular, and asymptotically flat, then singularities in the corresponding maximal spacetime are generically hidden inside a black hole.

- At time of original formulation (Penrose 69) only evidence originally was that all known explicit examples satisfied the conjecture!
- A heuristic mechanism and also that fact that one should consider "generic" data was only understood much later. (Christodoulou 94,99)

The Weak Cosmic Censorship Conjecture (in 3 + 1 Dimensions)

Conjecture (Weak Cosmic Censorship for Einstein Vacuum Equations) If the initial data is complete, regular, and asymptotically flat, then singularities in the corresponding maximal spacetime are generically hidden inside a black hole.

- At time of original formulation (Penrose 69) only evidence originally was that all known explicit examples satisfied the conjecture!
- A heuristic mechanism and also that fact that one should consider "generic" data was only understood much later. (Christodoulou 94,99)
- As with other fundamental questions in relativity (such as Strong Cosmic Censorship), the precise notion of regular initial data and singularity could affect the validity of the conjecture.

Easiest is to require initial data to be smooth, and say that a singularity occurs when smoothness is lost. Though this framework suffices in other situations, it is actually quite naive from various perspectives.

Easiest is to require initial data to be smooth, and say that a singularity occurs when smoothness is lost. Though this framework suffices in other situations, it is actually quite naive from various perspectives.

Some necessary conditions for a function space to study weak cosmic censorship:

### Definition of a Naked Singularity

A singularity is naked if there exists A > 0 and a collection  $\{\gamma_i\}$  of suitably normalized future oriented null geodesics which may start arbitrarily far out along an asymptotically flat cone and go extinct in affine time less than A.

## Spherically Symmetric Matter Sourced Spacetimes

As a warm-up to studying the Einstein vacuum equations, Christodoulou explored this conjecture in the situation when the spacetime is assumed to be spherically symmetric and is sourced by a scalar field:

$$\operatorname{Ric}_{\mu\nu}(g) = \partial_{\mu}\phi\partial_{\nu}\phi, \qquad \Box_{g}\phi = 0.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

# Spherically Symmetric Matter Sourced Spacetimes

As a warm-up to studying the Einstein vacuum equations, Christodoulou explored this conjecture in the situation when the spacetime is assumed to be spherically symmetric and is sourced by a scalar field:

$$\operatorname{Ric}_{\mu\nu}(g) = \partial_{\mu}\phi\partial_{\nu}\phi, \qquad \Box_{g}\phi = 0.$$

His main results were the following:

#### Theorem (Christodoulou 1994,1999)

There exist naked singularities for spherically symmetric Einstein-scalar field system! However, generically, naked singularities do not occur.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# Spherically Symmetric Matter Sourced Spacetimes

As a warm-up to studying the Einstein vacuum equations, Christodoulou explored this conjecture in the situation when the spacetime is assumed to be spherically symmetric and is sourced by a scalar field:

$$\operatorname{Ric}_{\mu\nu}(g) = \partial_{\mu}\phi\partial_{\nu}\phi, \qquad \Box_{g}\phi = 0.$$

His main results were the following:

#### Theorem (Christodoulou 1994,1999)

There exist naked singularities for spherically symmetric Einstein-scalar field system! However, generically, naked singularities do not occur.

(See also large heuristic/numerical literature on naked singularities associated to critical phenomenon...)

# Naked Singularities for the Einstein Vacuum Equations?

Despite Christodoulou's example, until recently there has been no progress in constructing naked singularities for the Einstein vacuum equations

 $\operatorname{Ric}(g) = 0.$ 

There are various reasons why:

# Naked Singularities for the Einstein Vacuum Equations?

Despite Christodoulou's example, until recently there has been no progress in constructing naked singularities for the Einstein vacuum equations

 $\operatorname{Ric}(g) = 0.$ 

There are various reasons why:

Christodoulou's construction relied on a reduction, under a "twisted" self-similarity, of the spherically symmetric Einstein-scalar field system to a *two dimensional autonomous system* and then a corresponding phase plane analysis. For the Einstein vacuum equations, one cannot expect such a dramatic reduction, and thus a completely different approach is needed.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### Naked Singularities for the Einstein Vacuum Equations?

Despite Christodoulou's example, until recently there has been no progress in constructing naked singularities for the Einstein vacuum equations

 $\operatorname{Ric}(g) = 0.$ 

There are various reasons why:

- Christodoulou's construction relied on a reduction, under a "twisted" self-similarity, of the spherically symmetric Einstein-scalar field system to a *two dimensional autonomous system* and then a corresponding phase plane analysis. For the Einstein vacuum equations, one cannot expect such a dramatic reduction, and thus a completely different approach is needed.
- If one tries to construct such a spacetime dynamically, one needs to simultaneously solve a *low-regularity* (due to the presence of singularities) and a *global existence* problem (since one has to construct the maximal possible spacetime and show that no black hole region forms).

#### Naked Singularities do Exist!

Despite the above difficulties, we have

#### Theorem (Rodnianski-S., Informal Version)

There exist naked singularities for the Einstein vacuum equations

 $\operatorname{Ric}(g) = 0.$ 

### Naked Singularities do Exist!

Despite the above difficulties, we have

Theorem (Rodnianski-S., Informal Version)

There exist naked singularities for the Einstein vacuum equations

 $\operatorname{Ric}(g) = 0.$ 

In the rest of the talk we will

- 1. Review Christodoulou's solutions in more detail.
- 2. Present our naked singularities and compare with Christodoulou's solutions.

There are two important symmetries:

1.  $a \in \mathbb{R}_+$  acts by  $(h, r, \phi) \mapsto (a^2h, ar, \phi)$ .

2.  $b \in \mathbb{R}$  acts by  $(h, r, \phi) \mapsto (h, r, \phi + b)$ .

A solution is described by a triple  $(h, r, \phi)$  where h is a 1 + 1 dimensional metric, r is the area radius function, and  $\phi$  is the scalar field.

There are two important symmetries:

1.  $a \in \mathbb{R}_+$  acts by  $(h, r, \phi) \mapsto (a^2 h, ar, \phi)$ .

2. 
$$b \in \mathbb{R}$$
 acts by  $(h, r, \phi) \mapsto (h, r, \phi + b)$ .

#### Definition

Let  $k \in \mathbb{R}$ . We say that a solution  $(h, r, \phi)$  is "k-self-similar" if there exists a 1-parameter family of diffeomorphisms  $\{f_s\}_{s>0}$  such that

$$f_s^* h = s^2 h,$$
  $f_s^* r = sr,$   $f_s^* \phi = \phi - k \log(s).$ 

If k = 0, then we say that solutions are "scale-invariant."

#### Scale-invariant Solutions

The scale-invariant solutions may be written down explicitly and are parametrized by the value  $a \doteq \partial_v (r\phi) |_{(u,v)=(-1,0)}$ . For  $a \ll 1$ , the spacetime is as follows:

# Theorem (Christodoulou, 1993)

The spherically symmetric Einstein-scalar field system is well-posed within the class of "solutions of bounded variation" (BV-solutions).

 Bounded variation spacetimes are locally modeled on scale-invariant solutions. That is, if you repeatedly rescale around a point on {r = 0} you converge to a scale-invariant solution.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

For  $0 < k \ll 1$ , the solutions cannot be written down explicitly. Nevertheless, Christodoulou showed that there exist solutions which correspond to naked singularities:

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

He could call his solutions naked singularities for the following two reasons:

He could call his solutions naked singularities for the following two reasons:

1. The initial data for the scalar field is  $C^{1,\alpha}$ , and thus, the initial data is *better* than a solution of bounded variation.

(ロ)、(型)、(E)、(E)、 E) の(の)

He could call his solutions naked singularities for the following two reasons:

1. The initial data for the scalar field is  $C^{1,\alpha}$ , and thus, the initial data is *better* than a solution of bounded variation.

2. The solution cannot be extended to the singular point and remain even a solution of bounded variation. For example:

2.1 Hawking Mass Concentration at Singularity:  $\lim_{r\to 0} \frac{m_H}{r} \sim k > 0$ .

2.2 Scalar-field blow-up:  $\int_{-1}^{0} \left| \frac{\partial \phi}{\partial u} \right| |_{v=0} du = \infty.$ 

Final Remarks:

He could call his solutions naked singularities for the following two reasons:

1. The initial data for the scalar field is  $C^{1,\alpha}$ , and thus, the initial data is *better* than a solution of bounded variation.

2. The solution cannot be extended to the singular point and remain even a solution of bounded variation. For example:

- 2.1 Hawking Mass Concentration at Singularity:  $\lim_{r\to 0} \frac{m_H}{r} \sim k > 0$ .
- 2.2 Scalar-field blow-up:  $\int_{-1}^{0} \left| \frac{\partial \phi}{\partial u} \right| |_{v=0} du = \infty.$

Final Remarks:

 Christodoulou has to apply a suitable truncation to obtain an asymptotically flat solution.

He could call his solutions naked singularities for the following two reasons:

1. The initial data for the scalar field is  $C^{1,\alpha}$ , and thus, the initial data is *better* than a solution of bounded variation.

2. The solution cannot be extended to the singular point and remain even a solution of bounded variation. For example:

2.1 Hawking Mass Concentration at Singularity:  $\lim_{r\to 0} \frac{m_H}{r} \sim k > 0$ .

2.2 Scalar-field blow-up: 
$$\int_{-1}^{0} \left| \frac{\partial \phi}{\partial u} \right| |_{v=0} du = \infty.$$

Final Remarks:

- Christodoulou has to apply a suitable truncation to obtain an asymptotically flat solution.
- The limit as  $k \to 0$  is singular. In fact,  $\partial_v \phi \sim k^{-1/2}!$

Part III: Naked Singularities in Vacuum

# Analogue of Self-Similar Solutions(?)

• We look for a solution  $(\mathcal{M}, g)$  which possesses a conformally Killing vector field K:

$$\mathcal{L}_{\mathcal{K}}g=2g.$$

(ロ)、(型)、(E)、(E)、 E) の(の)

### Analogue of Self-Similar Solutions(?)

▶ We look for a solution (*M*, *g*) which possesses a conformally Killing vector field *K*:

$$\mathcal{L}_{K}g = 2g$$

 We must first pick a concrete gauge. Natural to work in double-null coordinates

$$g = -2\Omega^2 \left( du \otimes dv + dv \otimes du 
ight) + g_{AB} \left( d heta^A - b^A du 
ight) \otimes \left( d heta^B - b^B du 
ight),$$

and to require that  $K = u\partial_u + v\partial_v$  is the generator of scaling symmetry.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

#### Analogue of Self-Similar Solutions(?)

▶ We look for a solution (*M*, *g*) which possesses a conformally Killing vector field *K*:

$$\mathcal{L}_{K}g = 2g$$

 We must first pick a concrete gauge. Natural to work in double-null coordinates

$$g = -2\Omega^2 \left( du \otimes dv + dv \otimes du 
ight) + g_{AB} \left( d\theta^A - b^A du 
ight) \otimes \left( d\theta^B - b^B du 
ight),$$

and to require that  $K = u\partial_u + v\partial_v$  is the generator of scaling symmetry.

▶ More explicitly, this implies that there exist  $\mathring{\Omega}$ ,  $\mathring{b}^{A}$ , and  $\mathring{g}_{_{AB}}$  so that

$$\begin{split} \Omega\left(u,v,\theta^{A}\right) &= \mathring{\Omega}\left(\frac{v}{u},\theta^{A}\right), \qquad b^{A}\left(u,v,\theta^{B}\right) = u^{-1}\mathring{b}^{A}\left(\frac{v}{u},\theta^{B}\right), \\ & \mathbf{g}_{AB}\left(u,v,\theta^{C}\right) = u^{2}\mathring{g}_{AB}\left(\frac{v}{u},\theta^{C}\right). \end{split}$$

・ロト・西ト・ヨト・ヨー もくの

# Null Constraint Equations Along $\{v = 0\}$

Along {v = 0} the null constraint equations implies that the following equation must hold along the sphere S<sup>2</sup> at (u, v) = (−1, 0):

$$\mathrm{d} \dot{l} \mathrm{v} b - \mathcal{L}_b \mathrm{d} \dot{l} \mathrm{v} b - rac{1}{2} \left( \mathrm{d} \dot{l} \mathrm{v} b 
ight)^2 = rac{1}{4} \left| 
abla \hat{\otimes} b \right|^2 + 4 \mathcal{L}_b \log \Omega - 2 \left( \mathcal{L}_b \log \Omega 
ight) \left( \mathrm{d} \dot{l} \mathrm{v} b 
ight).$$

# Null Constraint Equations Along $\{v = 0\}$

Along {v = 0} the null constraint equations implies that the following equation must hold along the sphere S<sup>2</sup> at (u, v) = (−1, 0):

$$\mathrm{d} \dot{l} \mathrm{v} b - \mathcal{L}_b \mathrm{d} \dot{l} \mathrm{v} b - rac{1}{2} \left( \mathrm{d} \dot{l} \mathrm{v} b 
ight)^2 = rac{1}{4} \left| ar{
abla} \hat{\otimes} b 
ight|^2 + 4 \mathcal{L}_b \log \Omega - 2 \left( \mathcal{L}_b \log \Omega 
ight) \left( \mathrm{d} \dot{l} \mathrm{v} b 
ight).$$

 Appears to be quite underdetermined; however, one can show that any solution satisfies

$$\mathcal{L}_b\Omega|_{\nu=0}=0, \qquad \mathcal{L}_bg|_{\nu=0}=0.$$

# Null Constraint Equations Along $\{v = 0\}$

Along {v = 0} the null constraint equations implies that the following equation must hold along the sphere S<sup>2</sup> at (u, v) = (−1, 0):

$$\mathrm{d} \dot{i} \mathrm{v} b - \mathcal{L}_b \mathrm{d} \dot{i} \mathrm{v} b - rac{1}{2} \left( \mathrm{d} \dot{i} \mathrm{v} b 
ight)^2 = rac{1}{4} \left| 
abla \hat{\otimes} b \right|^2 + 4 \mathcal{L}_b \log \Omega - 2 \left( \mathcal{L}_b \log \Omega 
ight) \left( \mathrm{d} \dot{i} \mathrm{v} b 
ight).$$

 Appears to be quite underdetermined; however, one can show that any solution satisfies

$$\mathcal{L}_b\Omega|_{\nu=0}=0, \qquad \mathcal{L}_bg|_{\nu=0}=0.$$

 After a further (scale-invariant) coordinate change one can take without loss of generality that

$$b=0, \qquad \Omega=1, \qquad {\it g\hspace{-0.1cm}/}_{AB}|_{\nu=0}=u^2 {\it g\hspace{-0.1cm}/}_{AB}^{({
m round})}.$$

This is a special rigidity associated to 3 + 1 dimensional problems!

# Fefferman–Graham Expansions

#### Theorem (Fefferman–Graham, 1985)

There exist formal power series in  $\frac{v}{u}$  representing scale-invariant solutions. Furthermore, these formal ambient metrics are uniquely characterized by

$$\mathrm{tf}\left(\partial_{v} \mathbf{g}\right)_{AB}|_{(u,v)=(-1,0)}.$$

In the following diagram we have shaded in the region formally covered by FG's power series:

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

### Existence of True Fefferman-Graham Spacetimes

#### Theorem (Rodnianski-S., 2018)

All of the formal expansions of FG correspond to actual solutions in a region  $\{u \in (-\infty, 0), \frac{v}{-u} \in [0, \epsilon)\}$  for suitable  $0 < \epsilon \ll 1$ .

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

#### Extensions to the Past

It is natural to ask about "filling-in" the cone with a regular spacetime. There turns out to be a rigidity, and we must fill-in with a flat spacetime:

#### Extensions to the Past

It is natural to ask about "filling-in" the cone with a regular spacetime. There turns out to be a rigidity, and we must fill-in with a flat spacetime:

This corresponds to a spherical impulsive wave; the metric will only be initially continuous across {v = 0}, and there is no real loss of regularity at the singularity. This is analogous to the case of k = 0 self-similar solutions in spherical symmetry.

#### Analogue of k-Self-Similar Solutions?

All Fefferman–Graham solutions have the property that the scaling vector field K is *null* and tangent to the cone {v = 0}:

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

### Analogue of *k*-Self-Similar Solutions?

All Fefferman–Graham solutions have the property that the scaling vector field K is *null* and tangent to the cone {v = 0}:

Natural to ask if we can construct a spacetime where the scaling symmetry is *spacelike* along the past cone of the singularity:

The flow of K yields a dilation of g only after a diffeomorphism! This can be considered analogous to the twisting of the k-self-similar solutions of Christodoulou.

#### How to Break the Rigidity

Again we work in double-null coordinates

$$g = -2\Omega^2 \left( du \otimes dv + dv \otimes du \right) + g_{AB} \left( d\theta^A - b^A du \right) \otimes \left( d\theta^B - b^B du \right),$$

(ロ)、(型)、(E)、(E)、 E) の(の)

and require that  $K = u\partial_u + v\partial_v$  is the generator of scaling symmetry.

#### How to Break the Rigidity

Again we work in double-null coordinates

$$g = -2\Omega^2 \left( du \otimes dv + dv \otimes du \right) + g_{AB} \left( d\theta^A - b^A du \right) \otimes \left( d\theta^B - b^B du \right),$$

and require that  $K = u\partial_u + v\partial_v$  is the generator of scaling symmetry.

• However, we now allow the lapse  $\Omega$  to be singular

$$\Omega \sim \left(\frac{v}{-u}\right)^{-\kappa},$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

for some  $0 < \kappa \ll 1$ .

#### How to Break the Rigidity

Again we work in double-null coordinates

$$g = -2\Omega^2 \left( du \otimes dv + dv \otimes du \right) + g_{AB} \left( d\theta^A - b^A du \right) \otimes \left( d\theta^B - b^B du \right),$$

and require that  $K = u\partial_u + v\partial_v$  is the generator of scaling symmetry.

However, we now allow the lapse Ω to be singular

$$\Omega \sim \left(\frac{v}{-u}\right)^{-\kappa}$$

for some  $0 < \kappa \ll 1$ .

$$g = -2\Omega^2 v^{2\kappa} \left( du \otimes d\hat{v} + d\hat{v} \otimes du 
ight) + g_{AB} \left( d heta^A - b^A du 
ight) \otimes \left( d heta^B - b^B du 
ight)$$

Now the metric extends to  $\{v = 0\}$ . (Though the form of the self-similar field is changed to  $u\partial_u + (1 - 2\kappa) \hat{v}\partial_{\hat{v}}!$ )

## Null Constraints Revisited

Now, along { v̂ = 0 } the null constraint equations along the sphere S<sup>2</sup> at (u, v) = (−1, 0) become:

$$\begin{split} \mathrm{d} \dot{i} \mathrm{v} b - \mathcal{L}_{b} \mathrm{d} \dot{i} \mathrm{v} b - \frac{1}{2} \left( \mathrm{d} \dot{i} \mathrm{v} b \right)^{2} = \\ & \frac{1}{4} \left| \nabla \hat{\otimes} b \right|^{2} - \boxed{4\kappa} + 4\mathcal{L}_{b} \log \Omega - 2 \left( \mathcal{L}_{b} \log \Omega \right) \left( \mathrm{d} \dot{i} \mathrm{v} b \right). \end{split}$$

#### Null Constraints Revisited

Now, along { v̂ = 0 } the null constraint equations along the sphere S<sup>2</sup> at (u, v) = (−1, 0) become:

$$\begin{split} \mathrm{d} \dot{i} \mathrm{v} b - \mathcal{L}_{b} \mathrm{d} \dot{i} \mathrm{v} b - \frac{1}{2} \left( \mathrm{d} \dot{i} \mathrm{v} b \right)^{2} = \\ & \frac{1}{4} \left| \nabla \hat{\otimes} b \right|^{2} - \boxed{4\kappa} + 4\mathcal{L}_{b} \log \Omega - 2 \left( \mathcal{L}_{b} \log \Omega \right) \left( \mathrm{d} \dot{i} \mathrm{v} b \right). \end{split}$$

The flexibility of κ allows us to break the rigidity, and we can find an infinite dimensional set of solutions. In the small data regime, we can essentially freely choose g, c√rl(b), and ν<sup>κ</sup>Ω.

# Embedding the Twisted Cones in a Spacetime

We have the following:

## Theorem (Rodnianski-S., 2019)

Along  $\{\hat{v} = 0\}$  we prescribe exactly self-similar data and give transversal data satisfying a suitable matching condition. Then we always have existence of the solution in a scale-invariant region:

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

#### Extending to a Global Spacetime: Exterior of a Naked Singularity

We may globalize our construction to the future.

# Theorem (Rodnianski-S., 2019)

There exists a naked singularity exterior: If we suitably extend the transversal data to an asymptotically flat cone, the corresponding maximal spacetime is contained in the region below:

The singularity is naked in that arbitrarily far out ingoing null curves originating from the initial data (such as  $\gamma$ ) intersect the future light cone of the singularity in time 1.

# Filling in the Light Cone

It is also of great interest to extend our solutions to the interior of the cone  $\{\hat{\nu}=0\}{:}$ 

# Theorem (S., 2022)

There exists a naked singularity interior: The solution in the previous theorem may be extended to the interior of the cone  $\{\hat{v} = 0\}$ , and in this extension the initial data forms a complete asymptotically flat cone:

#### Comparison with Christodoulou's Solutions I: Regularity of Initial Data

Across the cone {v = 0} the initial data of our solutions are C<sup>1,γ</sup> for γ ∼ ε<sup>2</sup>. The limited regularity is only in the v-direction; one can take arbitrarily many derivatives tangent to S<sup>2</sup>. This is qualitatively similar to Christodoulou's solutions.

Comparison with Christodoulou's Solutions I: Regularity of Initial Data

Across the cone {v = 0} the initial data of our solutions are C<sup>1,γ</sup> for γ ∼ ε<sup>2</sup>. The limited regularity is only in the v-direction; one can take arbitrarily many derivatives tangent to S<sup>2</sup>. This is qualitatively similar to Christodoulou's solutions.

▶ The initial data for Christodoulou's solutions are large in that  $\partial_{v}\phi|_{(u,v)=(-1,0)} \sim k^{-1/2}$ . Similarly, our initial data is large in that tf  $(\partial_{v}g)|_{(u,v)=(-1,0)} \sim \epsilon^{-1}$ .

Comparison with Christodoulou's Solutions I: Regularity of Initial Data

- Across the cone  $\{v = 0\}$  the initial data of our solutions are  $C^{1,\gamma}$  for  $\gamma \sim \epsilon^2$ . The limited regularity is only in the *v*-direction; one can take arbitrarily many derivatives tangent to  $\mathbb{S}^2$ . This is qualitatively similar to Christodoulou's solutions.
- ▶ The initial data for Christodoulou's solutions are large in that  $\partial_{v}\phi|_{(u,v)=(-1,0)} \sim k^{-1/2}$ . Similarly, our initial data is large in that tf  $(\partial_{v}g)|_{(u,v)=(-1,0)} \sim \epsilon^{-1}$ .
- ▶ Of course, for the Einstein vacuum equations, we cannot appeal to a well-posedness result for BV-solutions. However, away from the "axis," we can appeal to work of Luk-Rodnianski which allows for the v-derivative of the metric to only be in L<sup>2</sup>, as long as one has sufficient angular regularity. Furthermore, we expect that if we require Hölder-continuity in v (as well as sufficient additional angular regularity) then one may establish a well-posedness statement which includes the initial data we have.

In drawing analogies between the Einstein vacuum equations and the spherically symmetric Einstein-scalar field equations, the standard rules for comparison are

$$\partial_{\mathbf{v}}\phi \leftrightarrow \mathrm{tf}\left(\partial_{\mathbf{v}}\mathbf{g}\right) = \hat{\chi}, \qquad \partial_{u}\phi \leftrightarrow \mathrm{tf}\left(\partial_{u}\mathbf{g}\right) = \hat{\chi}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

In drawing analogies between the Einstein vacuum equations and the spherically symmetric Einstein-scalar field equations, the standard rules for comparison are

$$\partial_{\nu}\phi \leftrightarrow \mathrm{tf}\left(\partial_{\nu}g\right) = \hat{\chi}, \qquad \partial_{u}\phi \leftrightarrow \mathrm{tf}\left(\partial_{u}g\right) = \hat{\chi}.$$

• Christodoulou's solutions have  $\int_{u} |\partial_{u}\phi| du = \infty$  at the singularity. Our solutions have that  $\int_{\gamma} |\Omega \underline{\hat{\chi}}| ds = \infty$  for suitable null geodesics  $\gamma$  which converge to the singularity. (Also can find Jacobi fields which blow-up along suitable null geodesics.)

In drawing analogies between the Einstein vacuum equations and the spherically symmetric Einstein-scalar field equations, the standard rules for comparison are
